Metal Ratios in Passaic River Sediments

Lower Passaic River Restoration Project

Figure 15-4

September 2008

Figure 2.32: 2,3,7,8-TeCDD/ Σ TeCDD ratio for harbor sediments deposited in 1995 \pm 1 year (left) and in the mid-1960s (right). Data for the mp59.55i "upstream" indicator sample is noted with an arrow at top right. The ratios in atmospheric deposition measured in the Central Park Lake sediments and in "upstream" sediment delivery measured in the mp59.55i core are low in both time periods. The influence of the Western Harbor (80 Lister Avenue) source on Harbor sediments was much stronger in the 1960s, but is still responsible for ca. 50% of 2,3,7,8-TeCDD in recent deposition.
